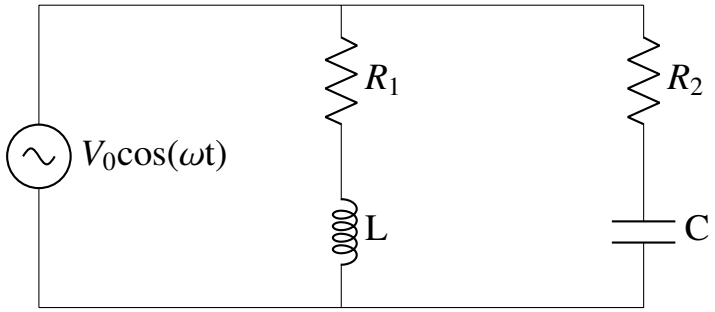
Question: In the circuit shown ,ω = 100πrads/s, R1=R2=2.2Ω and L=7mH. the capacitance C for which Y_{in} is purely real is ____ mF



(GATE IN 2023)

Solution:

variable	value	description	formulae
Y_{in}		Admittance of circuit	$\frac{R_1-Ls}{R_1^2-(Ls)^2}+\frac{R_2-\frac{1}{sC}}{R_2^2-\left(\frac{1}{sC}\right)^2}$
X_L	$7s\Omega$	Inductive reactance	sL
X_C	$\frac{1}{sC}\Omega$	Capacitive reactance	$\frac{1}{sC}$
s	100πj	Laplace complex frequency	$j\omega$
ω	100πrads/s	Angular frequency	
V	$V_0\cos(\omega t)$	voltage of source	
R_1, R_2	2.2Ω	resistance of resistors	

TABLE I
TABLE: INPUT PARAMETERS

According to the question given, Y_{in} is purely real , so imaginary part should be equal to zero

$$\implies \frac{-L\omega}{R_1^2 + (L\omega)^2} + \frac{\frac{1}{\omega \mathrm{C}}}{R_2^2 + \left(\frac{1}{\mathrm{C}\omega}\right)^2} = 0 \tag{1}$$

Table **??***to***??** (2)

$$\implies \frac{-7(100\pi)}{(2.2)^2 + (7(100\pi))^2} + \frac{\frac{1}{(100\pi)\mathrm{C}}}{(2.2)^2 + \left(\frac{1}{\mathrm{C}(100\pi)}\right)^2} = 0 \tag{3}$$

$$\implies \frac{-1}{4.4} + \frac{\frac{1}{(100\pi)\mathrm{C}}}{(2.2)^2 + \left(\frac{1}{(100\pi)\mathrm{C}}\right)^2} = 0 \tag{4}$$

$$\implies \frac{\frac{1}{(100\pi)\mathrm{C}}}{(2.2)^2 + \left(\frac{1}{(100\pi)\mathrm{C}}\right)^2} = \frac{1}{4.4} \tag{5}$$

$$\implies (2.2)^2 - \frac{4.4}{(100\pi)\mathrm{C}} + \left(\frac{1}{(100\pi)\mathrm{C}}\right)^2 = 0 \tag{6}$$

$$\implies \left(2.2 - \frac{1}{(100\pi)\mathrm{C}}\right)^2 = 0 \tag{7}$$

$$\implies \frac{1}{(100\pi)\mathrm{C}} = 2.2 \tag{8}$$

$$\implies \mathrm{C} = \frac{700}{484}\mathrm{mF} \tag{9}$$

$$\implies \mathrm{C} = 1.446281\mathrm{mF} \tag{10}$$

The capacitance of capacitor C is 1.45mF
